términos y condiciones

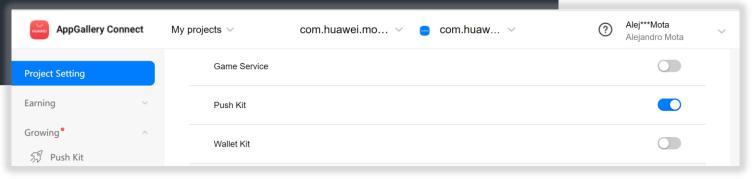

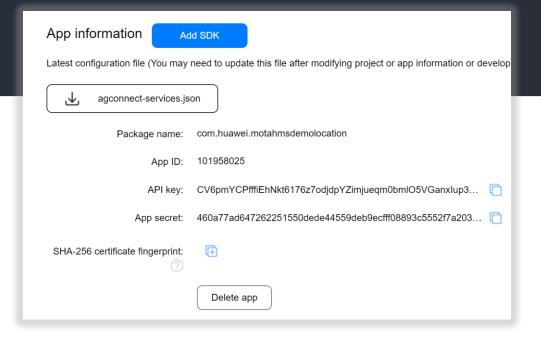

4 – Pasos de integración

1) **Habilita** Push Kit en AGC

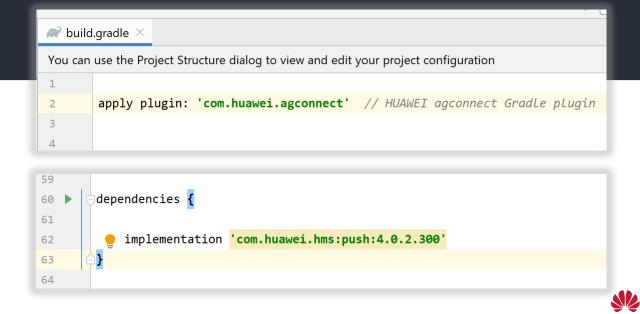

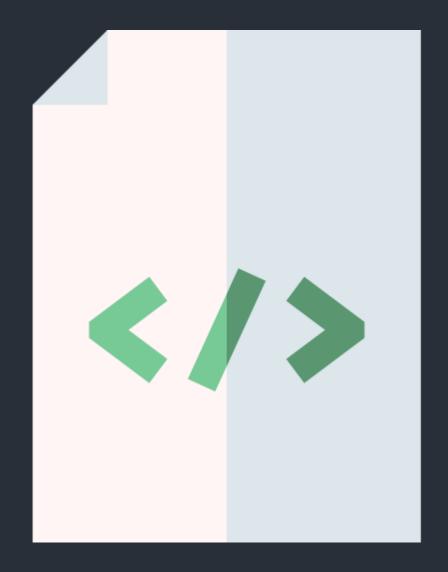

2) **Descarga** desde AGC y **AGREGA** a tu Proyecto el agonect-services.json

3) **AGREGA** dependencias y referencias en tu proyecto

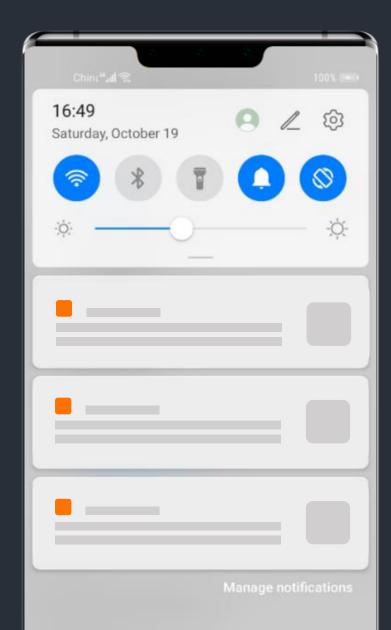

Implementa un llamado al servicio
ACCESS TOKEN - POST REQUEST

Envía la notificación usando el servicio **SEND MESSAGE** POST REQUEST

....lets CODE!

Declara el **SERVICE** debajo de la etiqueta **application** en tu **AndroidManifest.xml** para que los dispositivos puedan recibir los mensajes push token enviados por el Push Kit de HUAWEI

```
private void getToken() {
51
                Log.i(TAG, msg: "get token: begin");
52
53
                // get token
54
                new Thread() {
55
                    @Override
56
                    public void run() {
57 o
58
                        try {
                            String appId = AGConnectServicesConfig.fromContext(MainActivity.this).getString(|s: "client/app_id");
59
                             pushtoken = HmsInstanceId.getInstance(MainActivity.this).getToken(appId, s1: "HCM");
60
                            Log.i(TAG, msg: "get pushtoken");
61
                            if(!TextUtils.isEmpty(pushtoken)) {
62
                                 Log. i(TAG, msg: "get token:" + pushtoken);
63
                                 showLog(pushtoken);
64
65
                          catch (Exception e) {
                            Log.i(TAG, msq: "getToken failed, " + e);
67
68
69
                }.start();
72
```

Utiliza el metodo **getToken()** para obtener el TOKEN

Sobre-escribe el método **onNewToken**. Cuando un token cambia o la versión EMUI es anterior a la 10.0, llame al método onNewToken para devolver un token.

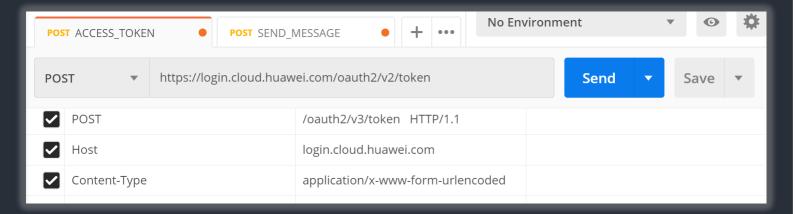

```
6 😓
        public class MyPushService extends HmsMessageService {
            private static final String TAG = "PushDemoLog";
9
           @Override
            public void onNewToken(String token) {
10 0
                super.onNewToken(token);
11
                Log.i(TAG, msg: "receive token:" + token);
12
13
14
```

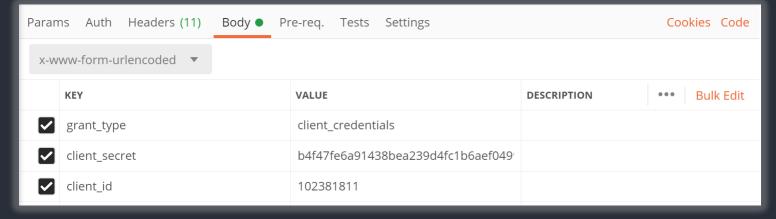

1

Envía un request POST a el servicio ACCES TOKEN

...Post Request, parametros Host y content-type son necesarios

Parametros en el Body) "Grant_type:client_credentials", "client_secret:App_secret" & "client_id:App_id"

RESPONSE(Formato JSON):

```
1  {
2     "access_token": "CV7iX2blc@mQ2318smsmcBzDx36
3     "expires_in": 3600,
4     "token_type": "Bearer"
5  }
```

2

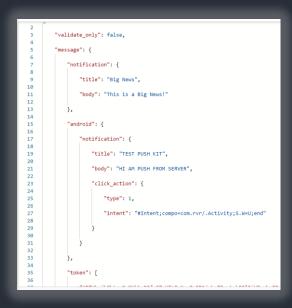

Envía un POST <u>request</u> a **SEND MESSAGE**

...Post Request, parametros Host and content-type son necesarios

	KEY	VALUE	DESCRIPTION	••• Bulk Edit
~	grant_type	client_credentials		
\checkmark	client_secret	ls_your_APP_Secret		
~	client_id	ls_your_APP_ID		

Body params) "Grant_type:client_credentials", "client_secret:App_secret" & "client_id:App_id"

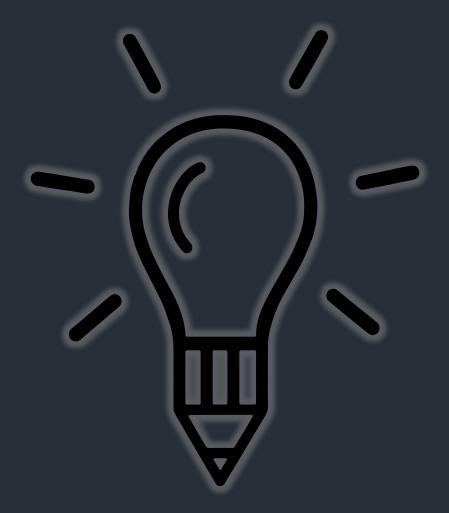

BODY(Formato JSON)

RESPONSE(JSON format):

```
1 {
2     "code": "80000000",
3     "msg": "Success",
4     "requestId": "159189150758098589000107"
5 }
```
